COMMUNICATIONS
A Key Component of Safe Surface Operations

2nd Edition
Introduction

Effective communications are a key component of every safe aircraft operation – both in the air and on the ground. Communication not only involves speaking, it also involves active listening. **This booklet focuses on communication procedures for safe surface operations at towered and non-towered airports.** However, some of the items emphasized are also applicable to aircraft in flight.

A few basics, such as message protocol and the meaning of some often misunderstood or overlooked terminology, are included in this booklet. Principles that every pilot should follow as part of their standard communication procedures are also identified. Common communication errors that have been made by pilots or air traffic controllers are illustrated with a scenario showing how the error occurred. Some of these errors resulted in an inconvenience, others resulted in close calls, and unfortunately, some ended with fatalities. There is also a section of Phraseology examples that demonstrate proper pilot and controller communications.

For all pilots, even if you only fly occasionally, it is essential to learn and use proper communication procedures and phraseology.
All successful flights begin with thorough pre-flight planning including developing a communications plan. Just as you compute takeoff and landing data, and plan your route and fuel consumption, you also need to plan communications. Your communications plan should contain the following:

- **Frequencies**: Identify and write down all the frequencies you think you might need, from taxiing out for takeoff to taxiing in after landing. Obtain the necessary frequencies from up-to-date charts, airport diagrams, and/or airport directories, such as the Airport/Facility Directory.

- **Automatic Terminal Information Service (ATIS)**: Use the ATIS and airfield diagrams to help you plan your taxi route for departure and arrival. Identify points along your taxi route where you will be crossing runways and/or taxiing through complex intersections.

- **Listen to the ground control frequency**: Be aware of what is going on around you. Always know what you are going to say BEFORE you key the microphone. This can be accomplished by preplanning your communications.
Adhering to the following principles in your radio communications will help you eliminate many of the common errors that occur in the aviation system. Make these principles part of your standard operating procedures:

1. Listen to the appropriate frequency and establish a “mental” picture of airport activity before transmitting.
2. Know and use standard aviation phraseology.
4. Listen. Be ready to write down instructions.
5. Remember, ATC may direct you to do something that was not in your plan. Don’t make the mistake of hearing what you expect or want to hear, rather than your actual ATC instruction.
6. Ask ATC for a clarification when in doubt about a clearance or an instruction.
7. Ask ATC to repeat their instructions if you are not sure about what you heard by saying “say again.”
8. Readback (including the runway identifier) all instructions and clearances to:
   i. hold short
   ii. position and hold
   iii. takeoff
   iv. land
9. Stop prior to the hold short marking and ask air traffic control if you aren’t sure whether you have clearance to enter or cross a runway.
10. Look left and right before entering a runway even after you have received clearance from the air traffic controller. Your scan of the runway and its associated approaches is a crucial link in the safety chain.
11. Ask for progressive taxi instructions if you are unfamiliar with taxi routes at a towered airport.
12. Be especially vigilant for potential conflicts involving the runway you are planning to use; Monitor the tower frequency or the Common Traffic Advisory Frequency (CTAF).
Some Basics to Know

Message Content
Use proper communications procedures when contacting air traffic control (ATC). Your initial transmission should contain these elements:

- Who you are calling
- Your call sign
- Where you are located on the airfield
- The alphabetical code for the ATIS, if available
- What you want to do, if it is short

State your position whenever making initial contact with any tower or ground controller, regardless of whether you have previously stated your position to a different controller. Be sure to use your full call sign. After the initial contact, the controller may abbreviate your call sign using “November” or aircraft type and the last three alphanumerics of your call sign; once the controller has done this, it is permissible for you to use the abbreviated call sign.

Standard Aviation Phraseology
In communicating with air traffic controllers or other pilots, use standard aviation phraseology at all times in order to facilitate clear and concise communications. The meaning of some common terms used in surface movement – along with the phonetic alphabet – is shown in the Glossary of Phraseology, starting on page 20.

Further information on standard aviation phraseology can be found in the Pilot/Controller Glossary section of the Aeronautical Information Manual located at http://faa.gov/atpubs.

Based upon reported incidents, there is some terminology used by air traffic controllers that is often misunderstood or overlooked by many pilots. Let’s review some of the common ones:
Some Basics to Know

➢ Taxi To:

a. When a controller says, "Taxi to Runway 5," that instruction permits the pilot to cross all intervening runways and taxiways along the taxi route but does not authorize the pilot to taxi on or cross Runway 5.

• When instructed to, "Taxi to Runway 5," you must stop at the hold short marking for Runway 5. Some runway configurations may require you to cross or back taxi to reach the approach end of the runway. In those instances, an explicit clearance is required.

b. When a controller says, "Taxi to ABC ramp," this instruction permits you to cross all runways and taxiways that cross your taxi route, unless the controller gives you a holding instruction.

➢ Position and Hold: This term is used by air traffic control to instruct a pilot to taxi onto the departure runway in takeoff position and hold. **It is not an authorization for takeoff and therefore does not permit the pilot to begin his/her takeoff roll.** The instruction is used when takeoff clearance cannot immediately be given because of traffic or other reasons such as wake turbulence. *(Note: The equivalent International Civil Aviation Organization (ICAO) instruction is “Line Up and Wait.”)*
**Some Basics to Know**

**Full-length:** If departures on a runway are being conducted from both the approach end of the runway and an intersection(s) along the runway, the controller will state “full length” when authorizing aircraft located at the approach end of the runway to either position and hold or takeoff.

- If a runway is only being used for full-length departures, the controller will not necessarily state “full-length” when issuing the takeoff clearance.

**Intersection:** When a controller gives a takeoff clearance or “position and hold” instruction to a pilot located at an intersection, the controller is required to *always state the name of the intersection in the transmission.*

If you are at an intersection and the controller gives you a takeoff clearance with “full-length” in it or omits the intersection designation, call the controller for clarification.

- It is possible that the controller knows you are at the intersection and inadvertently omitted the intersection designation in the transmission. It is also possible that the controller confused your call sign with the call sign of another aircraft that is located at the approach end of the runway.

- Pilots should state that they are at an intersection when requesting a takeoff clearance. When acknowledging the clearance, the pilot should reiterate that he/she is at an intersection.

**Follow:** When told to “follow” another aircraft, make sure that you understand that any instruction to follow another aircraft does NOT imply a clearance to cross, or take, an active runway.
Some Basics to Know

“Communications - A Key Component of Safe Surface Operations”

Sterile Cockpit

Focus on what ATC is instructing. Do not perform any non-essential tasks while communicating with ATC. Invoke the sterile cockpit rule while taxiing. Limit conversation with crewmembers and passengers to only what is essential for taxi and flight operations.

Progressive Taxi

If you are unfamiliar with the taxi route at an airport, or feel you need extra assistance, ask the tower for progressive taxi instructions. ATC will give you precise taxi instructions in stages as your aircraft proceeds along the taxi route. Don’t be intimidated by the controller or the volume of traffic on the frequency – if you need help, ask.

Good Radio Techniques:

Prepare first: Your transmission should be well thought out. Before keying your transmitter, know what you want to say and check to make sure you are on the proper frequency.

Communication with ATC should be concise and to the point. For unusual situations or lengthy communications, initial contact should be established first.

Acknowledge all clearances/instructions with your aircraft call sign. It is permissible to begin or end your acknowledgment with your call sign.
The preceding procedures also apply to operations at non-towered airports. However, some additional measures should also be taken at these airports.

- When flying to and from a non-towered airport, always monitor the local Common Traffic Advisory Frequency, also known as CTAF. Frequencies are listed on sectional charts and in airport directories.

- Proper use of CTAF builds situational awareness and increases the margin of safety for all pilots.

- Always transmit before taxiing, taking off, entering the traffic pattern, and landing.

- Routinely monitor and use CTAF within 10 miles of your destination airport.

- Remember some aircraft may not have a radio so always continuously scan the runways and approaches for other traffic.

- CTAF frequencies may be shared by several airfields in the same geographic area. For this reason, the message protocol is modified to begin and end the transmission with the airport name:
  
  - Identify the airport you are calling
  - State your call sign (you may also want to state your aircraft color and type)
  - State your position and your intentions
  - Repeat the airport name at the end of your transmission
Even at Non-Towered Airports, Failure to Communicate can be Fatal

A Beech 1900C commuter flight was approaching Quincy Airport, a non-towered facility, for landing, and asked over the CTAF that aircraft in the area respond. No replies were received, despite the fact that a King Air and a Cherokee were on the airfield preparing for takeoff.

On short final, the commuter pilot observed the two aircraft on the ground on an intersecting runway and asked if they were going to hold so she could land. Only the Cherokee responded, saying they would hold, but the rest of the message was garbled over the frequency. The commuter captain assumed the transmission had come from the King Air so did not ask the Cherokee pilot to “Say Again.”

Thirteen seconds before the commuter flight touched down, the King Air, which was in the number one position for takeoff, began its takeoff roll. The commuter flight and the King Air collided at the intersection of the two runways. All persons on both aircraft (14 people) were killed.

The NTSB determined that the probable cause of the accident was the failure of the pilots of the King Air “to effectively monitor the CTAF or to properly scan for traffic...”
In this section we identify common communications errors that have been made by pilots and controllers, and provide some specific examples of these errors. Even experienced air carrier pilots make these types of errors. Many of the incidents that are used as examples represent a combination of errors rather than a single mistake. This is your opportunity to learn from the mistakes others have made.¹

**Similar sounding call signs**

Two aircraft with similar sounding call signs on the same frequency can dramatically complicate communications. Similar sounding call signs can happen at any airport, but the probability increases at airports where an airline has a hub or where a flight school has several aircraft whose call signs only differ by a digit or two. Listen carefully to the frequency chatter and be alert for any other aircraft that has a call sign that is similar to yours.

¹Examples that are taken from the Aviation Safety Reporting System (ASRS) contain a reference to their ASRS Accession Number.
Some Common Communications Errors

NXX67H taxied out to a hold short marking for Runway 13 via Taxiway A. While NXX67H was holding short, Tower Control (TC) was working several other aircraft including NYY67H. Using only “67H” as the call sign, TC cleared NYY67H for departure and subsequently for a turn on course and frequency change. A transmission (possibly from NYY67H) was partially blocked but the final portion was heard as “...67H, right turn westbound.” Following this transmission, NXX67H assuming the instruction was intended for them, entered Runway 13 and departed without contacting TC. NXX67H’s departure conflicted with Cessna C152 on 1/8 mile final. The Cessna 152 saw NXX67H, initiated a go-around, and then side-stepped to avoid over flying NXX67H.

Do not make the “Assumption Mistake.”

Hearing what we expect to hear is a human tendency. Experience and skill cannot compensate for this natural perceptual limitation.

As one pilot said, “After 27 years of flying, I now find it becoming easier to ‘hear’ things in a clearance that are not really there. More diligence is required.” (ASRS Accession Number 199764).

You can help avoid this mistake with active listening. The “Assumption Mistake” has several variations. We have highlighted three of the most common mistakes:

• If any portion of the transmission is “garbled” or “stepped on,” do not assume the unheard portion is irrelevant. Request that the transmission be repeated by saying “say again.”

• If your call sign is not included in the transmission, don’t assume the transmission is for you.

• Listen, don’t assume the transmission is what you requested.
Some Common Communications Errors

Instructions that just “don’t seem right.”
If you’re given an instruction that doesn’t seem right to you, ask for clarification. In the following example, an aircraft that was placed in “position and hold” hears a landing clearance for another aircraft and proceeds to takeoff.

Aircraft #1, a Piper PA28, was cleared to position and hold on Runway 26 with Aircraft #2, another Piper PA28, cleared for stop and go on intersecting Runway 35L. Tower Control (TC) intended to clear Aircraft #3, a third Piper PA28, following Aircraft #2, for stop and go Runway 35L but used the wrong call sign: “Aircraft #1, Runway 35L, cleared for stop and go, make left traffic.” Aircraft #1 took this as clearance for departure and responded that he was departing to the southwest. TC stated: “Disregard, that’s for Aircraft #3, Runway 35L, cleared stop and go.” TC then observed Aircraft #1 airborne approximately 2,500 feet down Runway 26. As Aircraft #1 reached the intersection, Aircraft #2 was estimated to be 800 feet short of the intersection of Runway 26 & 35L and 200 feet higher (air to air) than Aircraft #1.

Readback errors
A “readback” is a pilot’s acknowledgment of an air traffic controller’s transmission that repeats the information that the controller conveyed. A pilot readback presents the first and most efficient opportunity to catch miscommunications. It provides a “reality check” in two ways:
Some Common Communications Errors

First, it tells the controller “this is what the pilot heard,” and secondly, it provides the controller the opportunity to reaffirm that is what he/she meant to say.

An effective readback can mitigate the effects of expectation, because it gives the controller an opportunity to correct the error. In the next example, a readback of what the pilot expected, rather than what was said, saved the pilot from an unauthorized landing, or worse. The controller, recognizing from the readback that the pilot had lined up on the wrong runway is able to amend the clearance to reflect the runway that the aircraft is approaching.

“The initial approach controller told us to expect an approach to Runway 18R. This ‘expect’ call, plus recent flights into [airport X] with construction on Runway 18L had us all thinking Runway 18R. The final controller apparently cleared us for 18L. We had the ILS set up for Runway 18R, and the captain read back, ‘Cleared for 18R’. I headed for Runway 18R. The tower then cleared us to land on 18R. On landing roll, the tower advised us to contact the approach controller about a little problem with our approach. We were all wearing headsets, but we heard what we expected instead of what was really coming over the headset.” (ASRS Accession Number 162629)

Pilot readbacks of controller instructions provide a critical part of the safety net. With no readback, there is a hole in the safety net.
Pilots should NEVER guess or readback what they thought they might have heard, and expect the controller to catch and correct any discrepancies. When in doubt, ASK.

As one pilot lamented, “I broke my ‘cardinal rule’ of taking questions over clearances out of the cockpit to the source.” (ASRS Accession Number 300858)

Hearback Errors
As we’ve seen, it is a natural human tendency to hear what you expect to hear, and this makes catching readback errors a very difficult task for controllers. When a controller misses an incorrect readback, we call this a “hearback” error.

Tower Control (TC) cleared Aircraft #1 for take-off Runway 10. Aircraft #2, reported ready for departure Runway 28 (opposite direction). TC advised Aircraft #2 to hold short. Aircraft #2 responded with his call sign and “Position and Hold.” TC did not catch the error. TC then observed Aircraft #2 enter Runway 10 departure end. TC aborted Aircraft #1’s take-off clearance. Closest horizontal separation was reported as 2,500 feet.
Sometimes communications errors are discovered and corrected in the readback or hearback phase. At other times, the communications errors are missed and the ensuing operation compromises safety standards. However, through pilot/controller intervention, and sometimes by pure coincidence, some incidents do not result in an accident. Unfortunately, as illustrated by the following example, there are instances when communications errors and omissions have led to fatal results.

Where: Sarasota, Florida; Sarasota Bradenton International Airport (SRQ)

When: March 9, 2000; mid-morning with VMC conditions

Who: Cessna 152: Instructor and Student
     Cessna 172: 2 Pilots
     Ground Control (GC)
     Tower Control (TC)
     Second Cessna 172
Runway 14 was being used for both full-length and intersection departures. Aircraft originating from the fixed base operator (FBO) on the south side of the runway were being taxied to the approach end of the runway for takeoff via Taxiway Alfa. Aircraft originating from the FBO on the north side of the runway were normally assigned intersection departures from Taxiway Foxtrot. (Taxiway Foxtrot was located approximately 1,300 feet from the approach end of Runway 14.)

A Cessna 152 with an instructor and student on board called ground control (GC) requesting a visual flight rules departure. He was instructed by GC to “Taxi to Runway 14.” The aircraft taxied via Taxiway Alfa to the approach end of Runway 14.
Less than three minutes later, the pilot of a Cessna 172 called GC and indicated he was at the FBO on the north side and “Ready to taxi.” The GC instructed him to “Taxi to Runway 14.” Although the aircraft’s location would have suggested an intersection departure, the GC annotated the flight progress strip as if the aircraft would be making a full-length takeoff. The GC later told investigators that he did not recall the C172 pilot indicating he was on the north side of the runway and since he did not mention the Foxtrot intersection in his taxi instructions must have thought the aircraft was on the south side of the runway. The Cessna 172 pilot held short of Runway 14 at Foxtrot behind a Piper Seneca. The pilot then contacted the Tower Controller (TC) and stated “We’re number two and ready for takeoff.”

At this time there was another Cessna 172 on Alfa that was holding for takeoff clearance behind the Cessna 152. Once the Piper Seneca took off, the TC issued a takeoff clearance to the Cessna 152.

(Nota: The full-length terminology discussed earlier in this booklet was instituted after this accident.)

Within 6 1/2 seconds of receiving acknowledgment of Cessna 152’s takeoff clearance, the TC, thinking that the Cessna 172 at Foxtrot was the aircraft located at Alfa, issued position and hold instructions to the pilot. The pilot proceeded to taxi onto the runway at Foxtrot into the path of the departing Cessna 152. All four people in the two aircraft were killed in the collision.
Accidents

Lessons Learned from Sarasota:
The GC erred in failing to hear that the Cessna 172 was on the north side of the field and in failing to mark the flight strip accordingly. However, there was at least one clue that should have made the Cessna 172 pilot suspicious about the “position and hold” instruction that he received from the TC - the controller did not mention the intersection. There are three other actions that the Cessna 172 pilot could have taken that may have prevented the collision:

• Specifically stating he was at an intersection as part of his initial contact with Tower control would have informed the TC that he was not at the approach end of the runway,

• Specifically stating he was at an intersection in acknowledging the “position and hold” instruction could have alerted the controller that he had given the instruction to the wrong aircraft and allowed him to take corrective action, and

• Scanning the runway prior to entry probably would have revealed the Cessna 152 on takeoff roll.

(Note: We have extracted the pertinent facts from this accident for the purpose of illustrating the communications aspect. The full accident report can be obtained from the NTSB’s website: http://NTSB.gov)
Standard Aviation Phraseology and Phonetic Alphabet

This section contains a glossary of phraseology commonly used in surface operations. For a complete listing of all aviation phraseology, consult the Pilot/Controller Glossary section of the Aeronautical Information Manual (AIM).

- **ACKNOWLEDGE** – Let me know that you have received my message.
- **ADVISE INTENTIONS** – Tell me what you plan to do.
- **AFFIRMATIVE** – Yes.
- **EXPEDITE** – Used by ATC when prompt compliance is required to avoid the development of an imminent situation. Expedite climb/descent normally indicates to a pilot that approximate best rate of climb/descent should be used without requiring an exceptional change in aircraft handling characteristics.
- **FINAL** – Commonly used to mean that an aircraft is on the final approach course or is aligned with a landing area.
- **HOLD FOR** (takeoff clearance, release, landing/taxiing aircraft, etc.) – Stay in place; where you are currently located.
- **HOW DO YOU HEAR ME?** – A question relating to the quality of the transmission or to determine how well the transmission is being received.
- **IMMEDIATELY** – Used by ATC or pilots when such action compliance is required to avoid an imminent situation.
- **NEGATIVE** – “No,” or “permission not granted,” or “that is not correct.”
- **POSITION AND HOLD** – Used by ATC to inform a pilot to taxi onto the departure runway in takeoff position and hold. It is not authorization for takeoff. It is used when takeoff clearance cannot immediately be issued because of traffic or other reasons.
- **READ BACK** – Repeat my message back to me.
Glossary of Phraseology

• ROGER – I have received all of your last transmission. It should not be used to answer a question requiring a yes or no answer. (See Affirmative, Negative).

• SAY AGAIN – Used to request a repeat of the last transmission. Usually specifies transmission or portion thereof not understood or received; for example: “Say again after ABRAM VOR.”

• STAND BY – Means the controller or pilot must pause for a few seconds, usually to attend to other duties of a higher priority. Also means to wait, as in “stand by for clearance.” The caller should reestablish contact if a delay is lengthy. “Stand by” is not an approval or denial.

• UNABLE – Indicates inability to comply with a specific instruction, request, or clearance.

• VERIFY – Request confirmation of information (for example, “verify assigned altitude”).

• WITHOUT DELAY – With a sense of urgency, proceed with approved instructions in a rapid manner.

• WILCO – I have received your message, understand it, and will comply with it (“WILCO” is a contraction of “Will Comply”).

International Civil Aviation Organization (ICAO) Phonetics

ICAO has adopted the following words to reduce confusion that may result from similar sounding letters and numbers.

Standard Aviation Phraseology Examples

➢ Taxi Instructions

• Initial Call for Taxi:

  Initial contact should include: Who you are calling, Call sign, Position, Request, and ATIS code (if available)

Example:

Pilot: Palwaukee Ground, Mooney Three One One Echo, Signature Aviation, with information Foxtrot, Request Taxi to Runway Three Zero.

Controller: Mooney Three One One Echo, Palwaukee Ground, Taxi to Runway Three Zero

• Initial Contact after Landing:

Example:

Pilot: Concord Ground, Cherokee Three Eight One Six Juliet, Clearing Runway Three Two Right at Echo, Taxi to ACME Aviation.

Controller: Cherokee Three Eight One Six Juliet, Concord Ground, Taxi to ACME.
Hold Short Instructions

A controller is required to obtain a readback for all hold short instructions issued. To minimize the need for additional radio transmissions, it is important that a pilot or vehicle operator always readback the hold short instruction, including the runway identifier.

• Taxi and Hold Short Instructions:

Example:
Controller: Bonanza Three One Zero Six Foxtrot, Runway Four, Hold Short of Runway Two Five at Taxiway Delta.

Pilot: Bonanza Three One Zero Six Foxtrot, Runway Four, Hold Short of Runway Two Five at Taxiway Delta.

• Land and Hold Short Instructions:

Land and hold short instructions require a pilot readback.

Example:
Controller: Baron Five Six Three Hotel, Cleared to Land Runway Three Six Right, Hold Short Runway Five for Departing Traffic.

Pilot: Baron Five Six Three Hotel Cleared to Land Runway Three Six Right, Hold Short Runway Five.
Standard Aviation Phraseology Examples

**Crossing Active Runways**

Pilots should pay particular attention to instructions that include a runway crossing or hold short instruction. If in doubt of the ATC instruction, verify it. If a pilot receives a clearance to cross an active runway, they should scan the area and proceed without delay.

**Example:**

Controller: *November Three Eight Six Bravo, Taxi to Runway Two Seven, Cross Runway Three Right.*

Pilot: *Ground, November Three Eight Six Bravo, Verify Clearance to Cross Runway Three Right.*

Controller: *November Three Eight Six Bravo, Affirmative, Cross Runway Three Right.*

**Immediate, Expedite, Without Delay**

If given an instruction that includes: “taxi without delay,” “immediate,” or “expedite,” the pilot is expected to comply promptly. If unable, advise ATC immediately.

**Example:**

Controller: *Mitsubishi Four Five Two Kilo, Runway Two Seven, Cleared for Immediate Takeoff.*

Pilot: *Tower, Mitsubishi Four Five Two Kilo, Unable Immediate Takeoff.*

Controller: *Mitsubishi Four Five Two Kilo, Cancel Takeoff Clearance, Hold Short, Runway Two Seven.*

Pilot: *Mitsubishi Four Five Two Kilo, Holding Short of Runway Two Seven.*
Position and Hold

It is a recommended Standard Operating Procedure (SOP) to read back “position and hold” instructions (see Advisory Circular 91-73A).

Example: Full-Length With No Intersection Departures.

Controller: Cherokee One Two Four Papa Hotel, Runway Two Seven Position and Hold, Traffic a Learjet Six Mile Final.

Pilot: Cherokee One Two Four Papa Hotel, Runway Two Seven, Position and Hold.

Example: Full-Length on a Runway being used for both Full-Length and Intersection Departures.

Controller: Cessna Five Three Two Seven Bravo, Runway One Niner Full-Length, Position and Hold.

Pilot: Cessna Five Three Two Seven Bravo, Runway One Niner Full-Length, Position and Hold.

Example: Intersection Departure.

Controller: Aztec Two Four Four Delta, Runway Three Six At Golf Five, Position and Hold.

Pilot: Position and Hold, Runway Three Six at Golf Five, Aztec Two Four Four Delta.
**Landing Clearance/Takeoff Clearance**

It is particularly important that pilots acknowledge all landing and takeoff clearances with his/her call sign. This is especially important at airports with multiple runways in use.

**Arrival Example:**

Controller: *Baron Six One Three Romeo, Boston Tower, Runway Nine Right, Cleared to Land.*

Pilot: *Baron Six One Three Romeo, Cleared to Land Runway Nine Right.*

**Departure Example:**

Controller: *Cherokee Two Seven Two Six Two, Charlotte Tower, Runway Two Three, Cleared For Takeoff.*

Pilot: *Cherokee Two Seven Two Six Two, Cleared for Takeoff, Runway Two Three.*

**Runway Exiting**

Pilots are expected to exit the runway at the first available taxiway or as instructed by ATC, and continue to taxi until you’ve crossed the hold short markings for that runway. Pilots should remain on tower frequency until advised to contact ground control.

**Example:**

Controller: *Duke Four One Two Six, Turn Right on Taxiway Golf and Contact Ground Control on Point Niner.*

Pilot: *Duke Four One Two Six, Roger.*
Non-Towered Airports

Arrival Example:
Frederick traffic, Apache Two Two Five Zulu, (position), (altitude), (descending) or entering downwind/base/final (as appropriate) Runway One Two full stop, Frederick.

Frederick traffic, Apache Two Two Five Zulu, clear of Runway One Two, Frederick.

Departure Example:
Frederick traffic, Queen Air Seven One Five Five Bravo, (location on airport), taxiing to Runway Two Three, Frederick.

Frederick traffic, Queen Air Seven One Five Five Bravo, departing Runway Two Three. Departing the pattern to the (direction), climbing to (altitude), Frederick.
This booklet contains many guidelines about communications, as well as information contained in the AIM. We recognize that to the new pilot or the pilot who only flies into an airport with a control tower occasionally, the task of communicating with ATC or other pilots may seem overwhelming. As a result, some pilots may try to avoid situations where they should be communicating on the radio. For this reason, it’s imperative that pilots understand their role in safe surface operations.

“The single most important thought in pilot-controller communications is understanding... Brevity is important, and contacts should be kept as brief as possible, but controllers must know what you want to do before they can properly carry out their control duties. And you, the pilot, must know exactly what the controller wants you to do. Since concise phraseology may not always be adequate, use whatever words are necessary to get your message across.”

-- AIM

Looking forward to hearing you on the frequency!
